

PowerBook 160 LCD Display Recapping Guide

Guide created by Steve of Mac84 • www.Mac84.net • Version 1.0

This PowerBook display contains 11 capacitors around a delicate frame. I did not use my hot air station to remove these capacitors as it may have risked damaging the many tiny connections to the display. The LCD uses **nine** 3.3uf / 35V capacitors, **one** 22uf / 35V, and **one** 100uf / 6V. You can replace the 100uf / 6V capacitor with a 100uf / **6.3V** capacitor if desired.
